

MQL Flow Ownership Map

This document translates the flowchart into a repo-ownership view: which parts are maintained in this repository, which are upstream external systems, and which are partial Salesforce-side handoffs.

High-level conclusion

This repo appears to own the Salesforce-centered decision engine and most of the downstream MQL workflow. It does not appear to own the broader marketing capture stack or the full upstream HubSpot, CMS, or portal applications.

Ownership legend

- **Maintained in repo:** Salesforce metadata, Apex, Flows, objects, and automation defined here
- **Partial / handoff in repo:** Salesforce-side intake, conversion, or integration touchpoints that connect to external systems
- **External / upstream system:** marketing platforms, portals, CMS, and score generation systems that feed Salesforce

Flow stages

1. Lead Capture

External / upstream system

- Web forms, ads, webinars, nurture, website engagement, and portal activity
- Most marketing capture and event generation

Partial / handoff in repo

- Contact Us and hand-raiser intake paths land in Salesforce
- Some Salesforce-side posting and conversion handoff exists

Maintained in repo

- Salesforce receives and stores intake records tied to later MQL processing

2. Qualification Engine

External / upstream system

- Behavior and fit score generation appears to come from HubSpot and connected systems

Maintained in repo

- Salesforce decision engine
- Threshold checks and qualification gates
- `Set_to_MQL__c` activation and MQL creation logic

3. MQL Creation and Routing

External / upstream system

- Upstream systems may provide source details and campaign context

Maintained in repo

- `MQL__c` object and field mapping
- Status assignment, opportunity linking, naming, owner routing, and alerts
- Hand-raiser and threshold-triggered creation paths

4. Sales Decision

External / upstream system

- Sales activity itself happens outside the repo

Maintained in repo

- Quick MQL screen flows
- Convert, reject, and add-to-opportunity flows
- Salesforce-side opportunity and contact role automation

5. Post-MQL Outcomes

External / upstream system

- Business outcomes and reporting consumption happen outside the codebase

Maintained in repo

- Lifecycle stage updates like `Active Opportunity` and `Recycled`
- Opportunity-stage-driven MQL and Contact automation
- Downstream status maintenance on Salesforce records

Important boundary

The repo uses scoring fields heavily, but the actual scoring model and most marketing event production appear to live outside this repo.

Evidence behind the mapping

- `force-app/main/default/classes/ContactSetToMqlTriggerHandler.cls`
 - Drives threshold and hand-raiser MQL creation

- `force-app/main/default/flows/Account_RT_AS_Set_Contacts_to_MQL.flow-meta.xml`
 - Converts scoring state into Salesforce qualification actions
- `force-app/main/default/flows/MQL_SF_Quick_MQL_Record.flow-meta.xml`
 - Supports sales-facing quick MQL actions
- `force-app/main/default/flows/MQL_SF_Convert_Reject_or_Add_to_Opportunity.flow-meta.xml`
 - Supports convert, reject, and add-to-opportunity decisions
- `force-app/main/default/flows/Opportunity_RT_AS_Update_MQL_Lifecycle_on_Stage_Change.flow-meta.xml`
 - Handles downstream lifecycle transitions
- `force-app/main/default/flows/Contact_Us_SF_Convert_to_MQL.flow-meta.xml`
 - Shows Salesforce-side conversion logic for Contact Us intake
- `force-app/main/default/objects/MQL__c/MQL__c.object-meta.xml`
 - Defines the core MQL business object
- `documentation/MQL_COHERENT_SPEC.md`
 - Documents system boundaries and the intended end-to-end process

Short version

If you compare the original diagram to the repo, the best summary is:

- Most of the **green middle column** is maintained here
- Most of **steps 3 through 5** are maintained here
- Only limited Salesforce-side touchpoints of **step 1** appear here
- The broader **marketing capture and scoring systems** are mostly external
